

SmallThings Guide

v1.5.1 — small tickable quality-of-life options for the Uncapped server (WoW 3.3.5a) · by **Mhortai**

What it is

SmallThings bundles small quality-of-life tweaks as individual checkboxes: tick only what you want, each option works on its own, and everything can be turned off as easily as it was turned on. Changes apply immediately and are saved per account.

Install & options

Drop the **SmallThings** folder into **Interface\AddOns** and restart the game fully — the 3.3.5 client only discovers an addon's files at launch, so a plain /reload is NOT enough after installing or updating. Options live in **Interface > AddOns > SmallThings**, via **/smallthings**, or through the minimap cog.

The options

Instant destroy **default: OFF**

Skips every delete confirmation, including the type-DELETE box for rare and better items — the moment the game would ask, the item is already destroyed. No confirmation means no safety net: epics delete as fast as greys, quest items included. If the client ever refuses the instant path, the normal confirmation appears instead; nothing is ever deleted twice.

Show IDs in tooltips **default: ON**

Adds Item ID, Enchant ID, Spell ID (spells, buffs, debuffs) and Talent ID lines to tooltips. Absorbed from the standalone IDTip addon — delete your IDTip folder, or every ID line shows twice.

Alt+Right-click item menu **default: ON**

Alt+Right-click any bag item for a small menu. **Equip** — shown for equippable items only. **Stash to Vault** — sends the item straight to the Uncapped Vault, no window needed; what may be stashed is decided by the server, and refusals (quest items, soulbound, keys, ...) are explained in chat by the server pack's own Vault addon. **Split** — shown for stacks of 2+, opens the normal stack-split window. Plain right-click, shift and ctrl clicks keep their default behavior.

Auto-sell greys **default: ON**

Every grey item is sold the moment a vendor window opens. One summary line in chat per visit, and only when something was actually sold.

Auto-sell whites **default: OFF**

The aggressive one: sells every white item with a sell price — gear, consumables, trade goods, recipes, everything. Quest items, the hearthstone and anything a vendor won't pay for are skipped automatically. Warning: vendor buyback only holds the last 12 items sold — if a visit sells more, the earliest are gone for good. Tick this deliberately.

Max camera zoom **default: ON**

Raises the camera distance cap to the client maximum (50) instead of the default slider limit (15). Unticking restores the default; re-applied at every login so the checkbox always matches reality.

UI error spam filter **default: ON**

Mutes the center-screen red spam: not enough rage / mana / energy / focus / runes / runic power, and ability / spell / item cooldown messages. Matched against the client's own error strings, so nothing else can ever be caught — inventory full, out of range and every other real error still shows exactly as before.

Crisp graphics default: OFF

One tick pushes the client past its video sliders: view distance (farclip) 1277 instead of 777, ground clutter density 256 / distance 140, full detail doodads, best clouds and weather, and 8x multisampling. Ticking saves whatever values you had first, so unticking restores *your* settings, not generic defaults. Everything applies instantly except MSAA, which the client only picks up at the next login (or /console gxrestart). This costs FPS, mostly in crowded zones — if the game ever chugs, this is the first tick to turn off. For even better edge smoothing, force 16x anisotropic filtering and antialiasing for Wow.exe in your GPU driver panel.

Class-colored chat names default: ON

Player names in every chat type — say, yell, whispers, party, raid, guild, officer, battleground, numbered channels — are colored by class using the client's own native flag: no message rewriting, so links and chat addons are untouched. Ticking saves your existing per-channel flags; unticking restores them exactly. Client limitation: a name colors once the client has seen that player's class (group, guild, nearby, targeted); strangers in Trade may stay uncolored until met.

Minimap button default: ON

A small cog on the minimap rim. Click opens the options panel; drag moves it anywhere around the rim, and the position is remembered. Untick to hide it — /smallthings always works regardless.

Chat timestamps default: ON

A soft grey hh:mm before every line in the default chat windows. The combat log is deliberately excluded. Ticking and unticking apply to new messages instantly; lines already printed are never rewritten. The server's own Uncapped Chat window stamps its own lines and is unaffected either way.

Auto-reset dungeons default: OFF

When you leave a dungeon, automatically sends the server's .reset command — the instant farm-reset, no typing. Fires exactly once per exit, only on dungeon-to-world transitions (never at login, never between instances, never on raid exits). Dot commands are intercepted by the server and never appear in public chat; the server's own reply confirms the reset or refuses it (for example if group members are still inside).

Requirements

The Stash entry relies on the Uncapped server pack being installed (it is, for every player on Uncapped) — without it, refused deposits fail silently and the item simply stays in your bag.

Changelog

v1.5.1 (2026-09-10)

- Fix: the auto-reset .reset command was sent the instant the outside world loaded, on the loading-screen edge where the server can silently drop chat. Now sent 1.5 seconds after landing.

v1.5.0 (2026-09-10)

- Auto-reset dungeons (default OFF): sends the server's .reset command once when leaving a dungeon; party-instance exits only, never at login or between instances.
- Docs repackaged to the standard deliverable set: the zip now contains only the addon; this Guide (changelog included) and the nutshell PDF ship alongside it.

v1.4.1 (2026-09-10)

- Fix: chat timestamps showed in the server's Uncapped Chat but not the default chat — the showTimestamps CVar used in v1.4.0 is a Cataclysm feature that doesn't exist on 3.3.5a. Reworked to Wrath-correct per-frame AddMessage prefixing; combat log excluded.

v1.4.0 (2026-09-10)

- Chat timestamps (default ON): grey hh:mm prefix on chat lines.

v1.3.1 (2026-09-10)

- Fix: Crisp graphics errored at login — horizonfarclip doesn't exist on the 3.3.5a client and the error aborted the preset mid-loop. Removed; all CVar access is now guarded so an unknown name can never break the preset again.

v1.3.0 (2026-09-09)

- Minimap button (default ON): cog on the minimap rim — click opens options, drag repositions, angle saved. Zero-dependency, hideable via its own tick.

v1.2.0 (2026-09-09)

- Crisp graphics (default OFF): CVar preset beyond the video sliders; saves previous values on tick, restores them on untick; MSAA applies at next login. FPS cost documented.
- Class-colored chat names (default ON): native per-chat-type class coloring for all types and channels 1-10; saves and restores previous flags; no message hooks.

v1.1.0 (2026-09-09)

- Auto-sell greys (default ON): sells all greys on vendor open, one pooled chat summary per visit.
- Auto-sell whites (default OFF): sells every white item with a sell price; price-zero items skipped by construction; 12-slot buyback warning.
- Max camera zoom (default ON): camera cap 50 while ticked, 15 restored on untick.
- UI error spam filter (default ON): mutes out-of-resource and cooldown messages, exact-matched against the client's own ERR_* strings.

v1.0.0 (2026-09-08)

- Initial release: options panel under Interface > AddOns, /smallthings command, per-account settings.
- Instant destroy (default OFF): auto-confirms all four delete dialogs, matched strictly by name.
- Show IDs in tooltips (default ON): item / enchant / spell / aura / talent IDs, absorbed from IDTip v1.0.0 (now retired).
- Alt+Right-click bag-item menu (default ON): Equip / Stash to Vault / Split; Stash uses the server's VLTDEP verb, eligibility and error messages server-side; all actions on the clicked bag/slot directly, no link matching.
- Planned but dropped: instant logout — the 20 s countdown is server-enforced; handled server-side instead.
